

FISHES OF THE FRESHWATER POTOMAC  
Compiled by Jim Cummins, The Interstate Commission on the Potomac River Basin

Always DRAFT - Version 11/10/2011

The following list of one-hundred and seventeen fish species known to be present in the freshwater portions of the Potomac River basin. Included, but not numbered, are fish that once were in the Potomac but are no longer present; eight extirpated fish species (only one of which, the log perch, was perhaps a native to the Potomac) and three with uncertain presences. The list was originally (1995) compiled through a combination of personal field experience, a search of the literature, and input from regional fisheries biologists Ed Enamait (MD), Gerald Lewis (WV), Ed Stienkoenig (VA), and Jon Siemiens (DC). However, I attempt to keep the list updated when new information becomes available, thus the list is always draft.

The distribution of these fishes within the Potomac is highly variable. Many are year-round residents and are fairly wide-spread, while some, such as the torrent shiner, are only found in very limited habitats/areas. Eleven are migratory species which typically come into the river system to spawn, and nine represent occasional visitors in freshwater-tidal areas. The native or introduced status of most of these species are generally accepted, but for some species this status is an object of continued research and therefore caution should be used in interpreting this designation, especially when noted with a “?” mark. Of the 117 species currently found in the river, approximately 80 (68%) are considered native, 22 (19%) are considered introduced, and the rest (15, or 13%) are uncertain in origin.
